

ABSTRACT

A PC (10) has an SSID and a WEP key required for wireless communication with a wireless LAN access point router (30). When the PC (10) has wireless connection with the Internet radio receiver (20) in Ad-Hoc mode, the PC (10) transfers the encrypted
5 SSID and WEP key to the Internet radio receiver (20). The Internet radio receiver (20) decrypts the transferred SSID and WEP key and validates the decrypted SSID and WEP key.
